Abstract: *The article discusses the importance of didactic, plot-role-playing, action games in developing the intellectual potential and logical thinking of preschoolers, and the fact that the correct and effective use of modern and innovative educational technologies depends on the pedagogical skills of each teacher.*

Keywords: *Developing a harmonious generation, preschool, young, children, intellectual, abilities, modern pedagogical, technological, initiative, economic, system.*

The economic power of each country, the rise of the socio-spiritual standard of living are determined by the competitiveness of the education system, the development of science. Therefore, the “Strategy of Actions for the Further Development of the Republic of Uzbekistan” sets as priority tasks the radical improvement of the education sector, the improvement of the quality of education, the formation of intellectual potential, a physically fit generation, in-depth teaching of exact sciences and the training of qualified personnel for various sectors of the economy, and ultimately the creation of an educational structure that can meet the demands of today. In order to implement the above priority tasks, the preschool education system, of course, plays an important role as the main foundation of an education system that meets the demands of today.

Preschool education is of great importance in raising a healthy and well-rounded child and preparing him for school. Unfortunately, the conducted analysis shows that in recent years, the preschool education system has been lagging behind. Instead of developing, the preschool education system has been lagging behind in preparing children for school education, and the coverage of preschool children in preschool educational organizations has decreased over the years. Over the past 20 years, the number of state preschool educational organizations has decreased by more than 45 percent, and today the coverage of children with preschool education in the republic is 30 percent.

In order to achieve success in the preschool education system, to carry out reforms, and to raise a healthy and well-rounded person, it is necessary to organize the educational and upbringing process in a high-quality manner based on the state educational program. What should be paid attention to in order to organize the educational and upbringing process in a high-quality manner in the preschool education system? First of all, the teacher must form himself and thoroughly prepare for the training process. After that, it is necessary to prepare a comfortable and healthy environment for the educational and upbringing process. For this

reason, it is required to effectively use modern and innovative technologies in the educational and upbringing process in preschool educational organizations.

Currently, pedagogical collections of preschool educational organizations are being intensively developed and innovative technologies are being introduced into their work.

Therefore, the main task of educators in preschool educational organizations is to select innovative pedagogical technologies that optimally correspond to the established goal of personal development, methods and forms of organizing work with children.

Modern pedagogical technologies in preschool education are a direction for the implementation of state standards of preschool education.

If we look at the technology of the preschool education system in Japan, they first set goals and then make plans. Rules for the formation of a child's personality in the Japanese preschool education system:

- you must have a positive relationship with your students;
- organize a class based on interest;
- don't do it for them. Help them do it themselves;
- use clear instructions and the language of the heart;
- always be ready for different situations.

To date, pedagogues widely use game technology to organize quality education and training in the preschool education system. Didactic, plot-role, action games are especially important in developing the child's intellectual potential and logical thinking. The correct and effective use of modern and innovative educational technologies depends on the pedagogical skills of each pedagogue.

Didactic games develop children's logical thinking, intellectual potential, attention, and memory. Below is one of the technology of the game Let's get acquainted with how many types. The "Name the Season" game has children repeating the signs of the seasons by looking at the pictures, and then repeating which season these signs belong to.

The game "Show the right gestures" consists of consecutive lines of gestures, children must repeat the indicated gestures in a short time. Using a stopwatch in the game makes the game more interesting.

Through the game, the child develops hand motor skills, movement speed, memory and attention. "Association flowers" game, the words of the core of the flower are found using associations with the theme of the leaves shown by the child. The game teaches associative thinking, finding cause-and-effect relationships between objects. Develops observation and attention. "Say the opposite" game the task may be more complicated for students of the preparatory group. It is appropriate to conduct this exercise without showing pictures. This game is important for educational activities with children of preschool age group. With its help, they learn to analyze, draw logical conclusions, choose antonyms, and correctly form phrases.

The game improves memory, concentration, thinking ability, listening ability, enriches vocabulary. The purpose of the teacher is to contribute to the development of children as

individuals. Pedagogical technologies help in this. The main task of pedagogues in the pre-school education system is to choose innovative pedagogical technologies optimally suited to the purpose and methods of organizing work with children. In conclusion, it should be noted that the further improvement of the preschool education system, which is an important link of the continuous education system, the formation of the young generation as a person with high potential and intellectual ability, quality preparation for school education. In addition to the education system, the main task of pedagogues is to organize the system professionally it is necessary to effectively use advanced experiences of foreign countries and modern innovative technologies.
